

Denise has calculated  $4 \times \frac{3}{14}$

From the picture I can see  
that  $4 \times \frac{3}{14} = \frac{12}{56}$

Do you agree?

Explain why.

Jack runs  $2\frac{2}{3}$  miles three times per week.

Josh runs  $3\frac{3}{4}$  miles twice a week.

Who runs the furthest during the week?

Explain your answer.
