

Pirate Treasure Ship

Science Experiment

Method

1. Before you begin the activity, make the pirate ship. Laminate the pirate ship images and glue them to the side of the margarine tub.
2. Put the pirate ship in the water tray. Count how many coins or weights it takes to sink the boat.

You will need:

Water tray

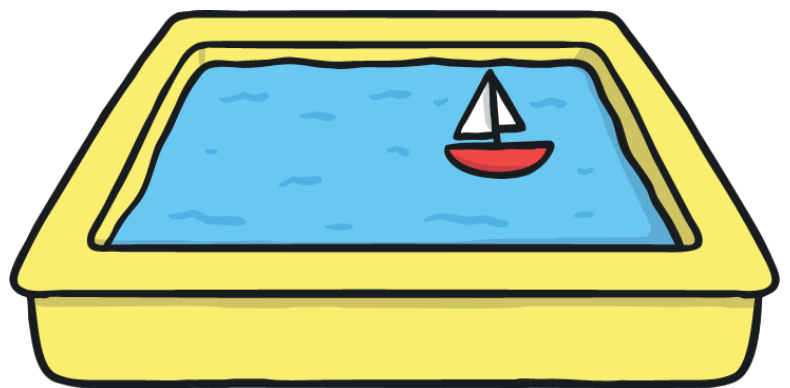

Margarine tub

Pirate ship images

Laminator

Glue

A collection of weights or coins (treasure)

The experiment could be extended by using a variety of different sized tubs for the boats or different types of treasure, some heavier than others.
